

Weekly Weather Hazards Assessment

Central America

- 1) Rains are continuing over eastern sections of Nicaragua where significant flooding occurred last week. The heaviest precipitation is along the coast, as expected, but the excessive rain further inland caused significant damage in the hatched region. The forecast indicates that heavy rains are likely to continue
- during the next week, especially near the coast. Inland areas where flooding has occurred can expect another significant wave from Friday through Saturday. This will act to hamper clean up efforts and may cause additional flooding where the ground has been previously saturated.
